Zepto Inventory Analysis

SQL Business Questions | MySQL 8.0+

Dataset Notes

- **Table:** `zepto` **Columns:** `category, name, mrp, discount_percent, available_quantity, discounted_selling_price, weight_in_gms, out_of_stock, quantity`
- `out_of_stock` holds **'TRUE'** / **'FALSE'**.
- The dataset has no sales data, so **revenue** means **potential revenue** = selling price × available quantity.
- Out-of-stock products usually show zero available quantity, so their value is measured by **selling price** only (Q7).
- Prices are in Rupees (Rs). Use **DISTINCT** where needed, because the same product can be listed more than once.
- Cut-offs such as “high-priced”, “large stock” and “heavy” are not fixed. Choose them after checking the data (averages or percentiles) and keep them consistent across queries.

SECTION A: STOCK AVAILABILITY

Scenario: The supply team wants to know where products are missing from the shelves.

Q1. Which categories have the highest stockout percentage?
Business purpose: Find the categories where supply is weakest.

Q2. Which high-priced products are out of stock?
Business purpose: Restock the most valuable products first (restock priority).

Q3. Which in-stock products are almost finished?
Business purpose: An early warning list, so products are reordered before they run out.

Q4. Do products with higher discounts go out of stock less often? Compare stockout rates across discount bands.
Business purpose: Test whether discounting is linked to availability and demand.

SECTION B: INVENTORY VALUE & WAREHOUSE EFFICIENCY

Scenario: The finance and warehouse teams want to know where money and space are tied up.

Q5. Which categories hold the most inventory value?
Business purpose: Show where the company's money is sitting in stock.

Q6. Which in-stock products have a very large stock but a low price?
Business purpose: They use up warehouse space but earn little per unit.

Q7. **How many products are out of stock in each category, and what is their total listed value?**

Business purpose: Estimate how much sales potential is missing because of stockouts.

SECTION C: DISCOUNT STRATEGY & MARGIN

Scenario: The pricing team wants to know where discounts are costing the most money.

Q8. **Which categories depend most on discounts? Show the average discount and the total discount amount given per category.**

Business purpose: See which categories rely most on discounting to sell.

Q9. **Which products have a discount above 40% and still hold a lot of stock?**

Business purpose: A large discount on a large stock means a big margin loss.

Q10. **Which in-stock products have no discount but a lot of stock?**

Business purpose: Candidates for a small promotion to move stock faster.

Q11. **Which expensive products (MRP above Rs 500) have a discount below 10%?**

Business purpose: Pricing review, to see if a small discount could attract more customers.

SECTION D: PRICING & DELIVERY EFFICIENCY

Scenario: The category and logistics teams want to understand price levels and the cost of handling heavy items.

Q12. **How are products spread across price tiers (Low / Mid / Premium), and which tier goes out of stock the most?**

Business purpose: Check whether the company holds too much budget or premium stock.

Q13. **Which heavy products give the lowest value per gram?**

Business purpose: Heavy and cheap items cost more to store and deliver than they earn.

SECTION E: PRODUCT PERFORMANCE (ADVANCED LEVEL)

Scenario: The management team wants to know which products and categories matter the most.

Q14. **What are the top 3 products by potential revenue in each category?**

Business purpose: Identify the star products of every category.

Q15. **Which categories together make up 80% of the total inventory value? (Pareto)**

Business purpose: Show where the business should focus its attention.
